

**Fee shifting: American to Complete Fee-Shifting**

Risk preferences unchanged: moderately risk averse; cost multiplier 1

private-noise / sigma-0p4; 10 signals; 10 offers; party noise 0.4; court noise 0.2; entry cost 0.15; trial cost 0.15.

| Decision           | Signal    | Original → Target | Direct | Opponent<br>entry | Opponent<br>offers | Opponent<br>exit | Opponent<br>agreement | Remaining | Sensitive |
|--------------------|-----------|-------------------|--------|-------------------|--------------------|------------------|-----------------------|-----------|-----------|
| P demand, continue | 0.05–0.95 | 0.55 → 0.45       | 0.00   | 0.00              | −0.10              | 0.00             | 0.00                  | 0.00      | No        |
| D offer, continue  | 0.05–0.95 | 0.55 → 0.45       | 0.00   | 0.00              | −0.10              | 0.00             | 0.00                  | 0.00      | No        |

Probability contributions are percentage points; pure offer changes are fractions of damages. Direct changes the rule or preferences first. Opponent entry, offers, exit and agreement contributions average all 24 replacement orders. Their sum plus Direct and Remaining equals the endpoint change before rounding. Remaining retains equilibrium-selection and continuation differences. Sensitive flags tie or off-path completion dependence; these are conditional diagnostics, not causal shares.

\*: an intermediate hybrid does not reach this history, although its continuation remains defined by positive opponent-and-chance reach.
