

Preferences: risk neutral to moderately risk averse

American rule remains in force; costs unchanged at multiplier 4.

Changed decisions only. Original: risk neutral; target: risk averse.

Direct: rule/preferences first. Entry, Offers, Exit: opponent contributions, averaged over six replacement orders. Change equals their sum plus Remaining, before rounding.

Probability changes are percentage points; pure demand/offer changes are fractions of damages. Mixed offers are shown as action probabilities, not averages.

*: partial, selection-dependent accounting; Remaining is the target action/mix minus the selected full-target-opponent response, not a fifth causal mechanism. †: tie-sensitive. §: sensitive to an unvisited opponent policy. ‡: conditional on an intermediate history not reached in that hybrid.

Undefined counterfactual: no opponent-and-chance reach; no numerical attribution is shown. These are conditional comparisons, not observed adjustment dynamics.

8 histories no longer reached; 5 newly reached. These have no comparable endpoint action and are omitted. Detailed diagnostics accompany the table.

Relative-payoff changes

Preferences: risk neutral to moderately risk averse; American rule remains in force; costs 4.

Supplement to partial strategy decompositions. Gap: conditional utility of actions gaining probability minus that of actions losing probability. Positive favors the gaining side.

All numbers on this page are 1000× utility differences (not percentages or money). The JSON/text files retain unscaled values. Mixtures weight each action by its share of the probability mass gained/lost between endpoints.

Direct/reopt.: new rule/preferences and optimized own continuation against the original opponent. Entry, Offers, Exit: marginal opponent replacements averaged over six orders. Original and Target use actual endpoint continuations; any final continuation mismatch is Remaining*. Change equals all five columns before rounding.

‡: tie-sensitive payoff allocation. §: unvisited-opponent-policy sensitivity. ‡: conditional on an intermediate history not reached in that hybrid. Undefined values are not zero.

These comparisons explain changes in relative incentives, not the exact equilibrium mixing probabilities or an observed dynamic path. Utility scales are convention-dependent, particularly across preference regimes, and are not cross-regime welfare comparisons.
