

Model-form and numerical sensitivity

A. Model form (10 offers)

Specification	Fee rule	Settled (%)	Trial (%)	Real costs	Net fidelity loss
Continuous merits	American	8.34	35.23	0.292	0.466
Continuous merits	British	18.26	25.62	0.266	0.455
Direct binary signals	American	17.59	24.98	0.258	0.262
Direct binary signals	British	9.90	12.77	0.224	0.224

B. Offer-grid sensitivity (continuous-merits baseline)

Specification	Fee rule	Settled (%)	Trial (%)	Real costs	Net fidelity loss
10 offers	American	8.34	35.23	0.292	0.466
10 offers	British	18.26	25.62	0.266	0.455
15 offers	American	0.00	34.43	0.262	0.447
15 offers	British	8.81	25.62	0.236	0.436

C. Multiple-start sensitivity (10-offer baseline)

Diagnostic	American	British
Requested Priors	50	50
Attempted Solves	99	99
Verified Recoveries	50	50
Distinct retained strategy profiles	21	11
Mean plaintiff demand: profile range	0.647–0.740	0.501–0.558
Settlement rate: profile range (%)	8.34–8.34	18.26–18.26
Trial rate: profile range (%)	35.23–35.23	25.62–25.62
Net fidelity loss: profile range	0.466–0.466	0.455–0.455
Maximum reported exploitability	2.67×10^{-15}	8.88×10^{-16}

Cost multiplier 1; risk neutral; 10 party-signal bins throughout. Settlement and trial use all potential disputes. Costs/losses are in damages units. A changes the information structure, not only the solver. B changes offers, not signals. C ranges are descriptive across retained profiles, not confidence intervals; repeated endpoints indicate no dispersion at reported precision.
