0.40–0.60

0.20–0.40

0.00–0.20

Liable

Not liable

Court finding ($\sigma = 0.40$)

This Sankey diagram illustrates the distribution of merits intervals Q across two court finding outcomes: 'Liable' and 'Not liable'. The initial state on the left is divided into five intervals: 0.80–1.00, 0.60–0.80, 0.40–0.60, 0.20–0.40, and 0.00–0.20. The 'Liable' outcome on the right is divided into two intervals: 0.60–0.80 and 0.40–0.60. The 'Not liable' outcome on the right is divided into three intervals: 0.40–0.60, 0.20–0.40, and 0.00–0.20. The flows are as follows: from 0.80–1.00 to 0.60–0.80 (Liable); from 0.60–0.80 to 0.60–0.80 (Liable) and 0.40–0.60 (Not liable); from 0.40–0.60 to 0.40–0.60 (Liable) and 0.20–0.40 (Not liable); from 0.20–0.40 to 0.40–0.60 (Not liable); and from 0.00–0.20 to 0.00–0.20 (Not liable). The flows to 'Liable' are predominantly blue, while flows to 'Not liable' are predominantly orange. The width of each flow represents its relative magnitude.
