

Merits interval Q

0.80–1.00

0.60–0.80

0.40–0.60

0.20–0.40

0.00–0.20

Liable

Not liable

True liability T

The diagram is a Sankey plot showing the distribution of 'Merits interval Q ' (y-axis) across two categories of 'True liability T ': 'Liable' and 'Not liable'. The y-axis is divided into five intervals: 0.80–1.00, 0.60–0.80, 0.40–0.60, 0.20–0.40, and 0.00–0.20. On the left, five vertical bars represent the source distribution. On the right, two vertical bars represent the destination distribution for 'Liable' and 'Not liable'. Shaded gray areas represent the flow of merits from the source to the destination. A thick dark gray line highlights a specific path: it starts in the 0.60–0.80 interval on the left, flows to the 'Liable' bar on the right, and then continues to the 'Not liable' bar on the right. Other lighter gray flows show various other paths between the intervals and liability categories.
