

Welfare decompositions: rule and behavior

34 of 36 American/British pairs are available. Each pair uses independently audited full profiles, including agreement and off-path actions. Alternative truth maps are not included.

Write W_{rs} for welfare evaluated under rule r with the complete profile solved under rule s ; A denotes American and C denotes British. The mixed corners are evaluations of fixed profiles, not new equilibria. The two effects average the two replacement orders:

$$R = \frac{1}{2}[(W_{CA} - W_{AA}) + (W_{CC} - W_{AC})], \quad B = \frac{1}{2}[(W_{AC} - W_{AA}) + (W_{CC} - W_{CA})].$$

The signed total is $\Delta = W_{CC} - W_{AA} = R + B$. No equilibrium-selection inference follows from this accounting decomposition. All five measures use their existing monetary definitions and population weighting. They are not combined.

Real litigation expenditures

Each row is one matched American/British comparison from the preceding key. Monetary units are damages = 1. R is the mechanical rule effect; B the behavioral effect; Δ British minus American. Four significant figures are shown; all calculations use the retained unrounded corners. Tiny nonzero residuals are printed, not clipped.
